

# R.F.I.D. Systems Implementation

Radio Frequency Identification "RFID" is a genetic term for technologies that use radio waves to automatically identify an object or people. Its inner workings consist of a tag, with a microchip ip and a coiled antenna, and an interrogator/reader with the antenna. We will provide trained personnel to come into your facility and attach a RFID tag to each file or asset, which you want to be tracked. The process goes further than simply applying the tag to the item, the tag now needs to be implemented into a tracking system and given an identity. We personally will attach and activate the tag and perform the "marriage" of the now identified tag into the tracking system. Once the system has been activated, you can proceed to track the tagged items with the RFID tag or the bar-code, if using the proper tracking system. Most systems only provide for the tracking of assets with either RFID or bar-code. We uses a tracking system that allows you to track with bar-code label and RFID within the same system. This tracking system affords you the flexibility to track high value items with an RFID tag while continuing to track less valued items with bar-code.
